

JOB STORY

Trench Rock:
NJ Trench Rock Project

Project: Trench was 100'+ long,
5' feet wide and 4'-8' deep.
Rock: Diabase
Drill hole diameter: 2 1/2"
diameter holes

Trench split using a presplit
down the sides and a staggered
"diamond" pattern in the center.

"Note the nice presplit wall
made by Da-mite".

After Da-mite cracked the rock, b/c of the large pieces left, impact hammers were used to further breakdown the rock and separate it from each other.

Impact hammers could not break the rock. Da-mite was required to create initial cracks so the hammers could be effective.
